STAT	
_	SUBJECT: Contract TA-3034 Interim Invention Report
/ ~	
STAT ⁷	Dear
STAT	Under the provisions of the Patent Rights Article of the subject contract. Contractor hereby reports disclosure as a Subject Invention.
	A copy of the disclosure is attached. It is not the intention of Contractor to file a patent application on this disclosure.
STAT	Very truly/vours.

	likewise distorting the wavefront emerging from DCE.
	By folding Figure ha approximately along line A-E and substituting the equivalent parallel plate system as shown in figure 1-B, the point of the cone to be is the result.
	Figure 2 shows a diagram of the rotating feed. In order to obtain a compact rotating elements of high efficiency the rotary joint had to be combined with the feed. This unit is designed to operate in a pressurised compartment thereby eliminating the problem of pressure sealing the rotating joint assembly.
	figure 3 shows a diagram of the horizontal beam shaping method. A phase front passing through the curved bend is delayed more at the center of the bend that at the edges because of the increased path length in that direction thus tending to straighten the phase front, or narrow the emerging beam.
	Figure 4 shows an alternate method of beam shaping. The back reflecting wall is curved to both colliminate and control the direction of the beam.
	In all cases the vertical beam is sharpened using a parabolic shaped cylindrical reflector. Vertical scanning at 2 cycles per second ±5 degrees is accomplished by nodding the entire antenna with a hydraulic actuator.
	For use as a bombing and reconnaissance antenna. The vertical scanning is not recessary. The cylindrical reflector is shaped for approximately csc2 cos of distribution.
	A flyable hab model of this anterna has been built and tested with satisfactory results.
